CommerceIQ Hiring Team

Re: Software Development Engineer I — Bengaluru

I am applying for the Software Development Engineer I role at CommerceIQ. The opportunity to build AI-driven agents that automate content, media, and sales execution for Fortune 100 CPG brands is exactly the intersection of distributed systems engineering and applied intelligence I want to grow into. CommerceIQ's position as the category leader in autonomous commerce—orchestrating real-time decisions across retail media, shelf content, and promotional levers at scale—makes it the ideal environment for an engineer who thinks in terms of reliable event pipelines and service-oriented design.

My Order-Processing Microservice Platform demonstrates end-to-end competency in the technical stack the JD calls out: Java and Spring Boot microservices (inventory-check, fulfilment, notification) communicate over Apache Kafka topics with idempotent consumers, manual offset commits for exactly-once semantics, dead-letter queue handling for failed events, and SQS as an asynchronous fallback channel. The system sustains ~3,000 orders/sec on a 2-broker cluster with horizontal consumer-group scale-out, persisting to an operational data store on AWS RDS PostgreSQL. This is the kind of high-throughput, fault-tolerant asynchronous messaging and service-oriented architecture CommerceIQ's commerce agents require to act on real-time retail signals without data loss.

In production at Sobhana Polyclinics & Diagnostics, I built and operate a Java/Spring Boot backend whose modules—radiology, laboratory, payout—communicate through a Kafka-style publish-subscribe pattern. Decoupling report-generation producers from payout-computation consumers reduced inter-module coupling and improved availability, a direct analogue to the distributed, loosely-coupled agent topology CommerceIQ describes. I own the full lifecycle: schema design, REST API contracts, JWT/RBAC security, Docker containerisation, and GitHub Actions CI/CD—giving me the end-to-end ownership mindset your team values at the SDE-I level.

I am available to join from June 2026 and am fully open to relocating to Bengaluru. I would welcome the chance to discuss how my Kafka-based distributed systems work and Java/Spring production experience map to CommerceIQ's AI agents for commerce.

Sincerely,

Saipranav Reddy Chintakunta
